Emily Cafe - End-of-Day Report

November 4, 2026 | POS, branch access, and kitchen workflow | Implemented, checked, committed, and pushed

Completed

- Added branch-scoped staff access and server-side role checks for branch operations.
- Added dine-in POS for available tables and active menu items, with server-side price and tax calculation.
- Added team access management for assigning branch roles.
- Added KOT records and item-level statuses: New, Accepted, Preparing, Ready, Completed, and Cancelled.
- Added KOT permissions: owners and branch managers can manage tickets; waiters can view and send; kitchen staff can view and update item preparation status.
- Added a kitchen queue page that refreshes every 15 seconds. POS order creation and KOT sending are separate actions.
- Added database schema and migration files for branch membership and KOT records.

Verification

- Backend TypeScript build passed.
- Frontend TypeScript check passed with incremental output disabled.
- git diff --check passed.
- Commit 1f7c7f0 (feat: add branch POS and kitchen KOT workflow) was pushed to origin/main.
- Both existing stashes were preserved.

Follow-up

- Apply backend/migrations/002_kots.sql to the development database before trying the KOT API against it.
- POS does not yet provide a special-instructions field, although the KOT API accepts item instructions.
- Printer integration and automated end-to-end database tests are not included in this milestone.
- Current workflow permits one KOT per order and uses a sequential item-status path. Confirm these rules with the team before expanding order editing or partial-ticket workflows.
